

**Why Family Violence Makes People Sick**  
 New Research on the Lifetime Health Effects of Adverse Childhood Experiences

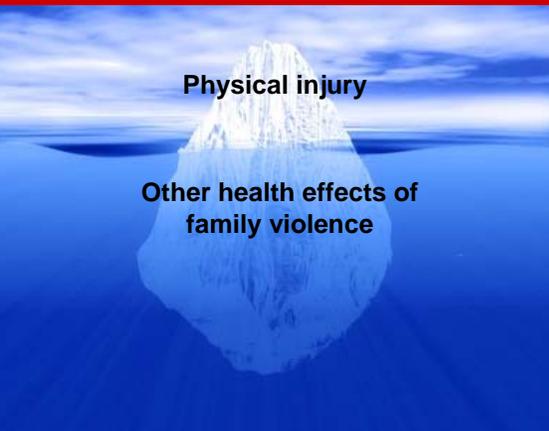

*Kathleen Kendall-Tackett, Ph.D.*  
 Clinical Associate Professor of Pediatrics

TEXAS TECH UNIVERSITY  
 HEALTH SCIENCES CENTER  
 at Amarillo

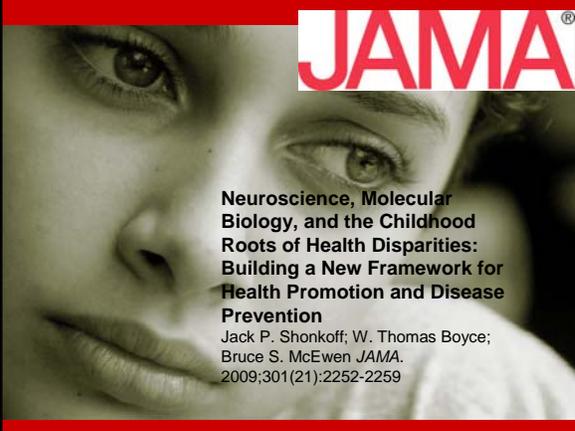

**Family Violence as a Public Health Issue**

- Centers for Disease Control and Prevention
- American Medical Association
- American Academy of Pediatrics
- American College of Obstetrics & Gynecology
- American Psychological Association
- World Health Organization

**Physical injury**

**Other health effects of family violence**

**JAMA**

**Neuroscience, Molecular Biology, and the Childhood Roots of Health Disparities: Building a New Framework for Health Promotion and Disease Prevention**

Jack P. Shonkoff; W. Thomas Boyce; Bruce S. McEwen *JAMA*. 2009;301(21):2252-2259

**“Adult disease prevention begins with reducing early toxic stress”**

**“An increasing amount of research in neuroscience, social epidemiology, and the behavioral sciences suggests that a reduction in the number and severity of early adverse experiences will lead to a decrease in the prevalence of a wide range of health problems.”**

the **ACE** Study

**Adverse Childhood Experiences (ACEs) are related to the leading causes of premature mortality and preventable death in adults**

Felitti et al., *Am J Prev Med* 1998

**Patients with 4 or more ACEs had higher rates of:**

- Ischemic heart disease
- Cancer
- Stroke
- Chronic bronchitis
- Emphysema
- Diabetes
- Skeletal fractures
- Hepatitis

**Adverse Childhood Experiences (ACE) include:**

- Child Sexual Abuse
- Child Physical Abuse
- Child Emotional Abuse
- Witnessing Intimate Partner Violence
- Parental substance abuse
- Parental criminal activity
- Parental mental illness
- Parental divorce

- Higher rates of healthcare use
- Higher healthcare costs
- More reported symptoms
- Overall less satisfaction with their health

- Higher rates of STDs, including HIV
- Earlier and more unintended pregnancies
- More sleep problems
- More metabolic syndrome and diabetes
- More cardiovascular disease
- Higher rates of autoimmunity

- Childhood and adult abuse is associated with at least five types of chronic pain
  - Back Pain
  - Headaches/TMJ
  - Pelvic Pain/Interstitial Cystitis
  - Irritable Bowel Syndrome
  - Fibromyalgia
- Many of these co-occur

**Parent Factors**

- May be an abuse survivor
- Possible current depression
- Substance abuse
- Partner violence

**Child Factors**

- May be at risk for abuse and neglect
- May show sequelae of maltreatment

**Adverse Childhood Experiences Study (N=17,337)**

- Emotional abuse 11%
- Physical abuse 28%
- Sexual abuse 21%
- Mother treated violently 13%
- Substance abuse 27%
- Household mental illness 20%

**Number of ACEs Reported**

- 0 36%
- 1 26%
- 2 16%
- 3 10%
- 4 or more 13%

**Survey of Mothers' Sleep and Fatigue Kendall-Tackett & Hale**

- Online survey of 6,410 mothers with infants aged 0-12 months (Mean infant age=6.96 months)

**Survey of Mothers' Sleep and Fatigue Full Sample (N=6,410)**

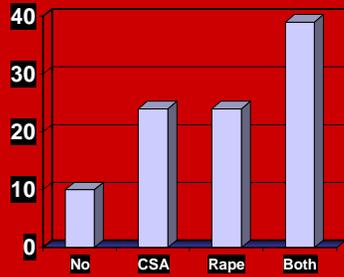

- Hit or slapped hard enough to leave a mark 34%
- Rape as teen or adult 13%
- Total sexual trauma ~25%
- Parent depressed 36%
- Parent hit, bitten or kicked 16%
- Parental substance abuse 32%

**Survey of Mothers' Sleep and Fatigue Sexual Trauma Data**

- No childhood sexual abuse, rape or adult trauma (N=2679)
- Child sexual abuse only (N=142)
- Rape as a teen or adult (N=715)
- Child sexual abuse and rape (N=137)

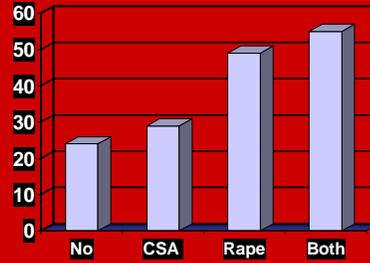

### Parent kicked, bitten, or hit

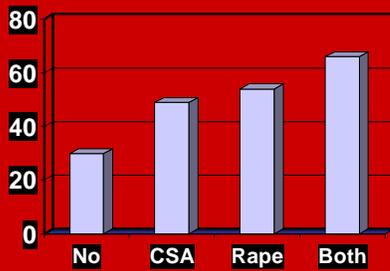

Data from the Survey of Mothers' Sleep and Fatigue

### Parent an Alcoholic

Data from the Survey of Mothers' Sleep and Fatigue

### Parent Depressed

Data from the Survey of Mothers' Sleep and Fatigue

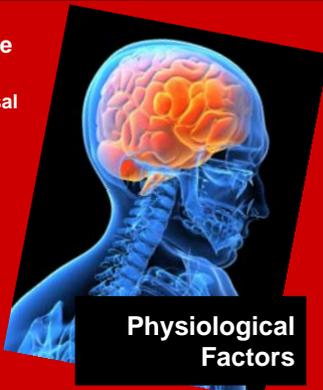

### Domains of Functioning Impacted by Adverse Childhood Experiences

- Physiological
- Behavioral
- Cognitive
- Social
- Emotional

### • Trauma changes the body

- Chronic hyperarousal
- Sleep disturbances
- Lowered pain threshold
- Increased cardiac reactivity
- Abnormal levels of norepinephrine and cortisol
- Abnormal immune function

### Physiological Factors

### Behavioral Factors

- Eating Disorders/Obesity
- Substance Abuse
- Smoking
- High-risk sexual behavior
- Suicide attempts
- Sleep problems

### Cognitive Factors I: Beliefs about Self

- Shame/self-blame
- Attributional style
- Self-efficacy
- Health perception

### Cognitive Factors II: Beliefs about Others

- Internal Working Model
- Mistrust & Hostility
- Rejection Sensitivity
- Religiosity

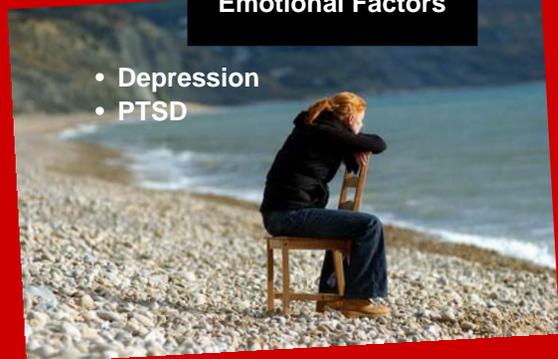

- Insecure Attachments
- Quality of Current Relationships
- Divorce
- Social Isolation
- Co-Dependent Style
- Low Income
- Homelessness
- Revictimization

### Social Factors

### Emotional Factors

- Depression
- PTSD

- How can pediatricians respond?

### Provider-level Barriers

- No time during appointments
- Lack of knowledge about topic
- Belief that FV is not within scope of practice
- Not comfortable with topic
- No place to refer
- Afraid to make the problems worse for families

## Pandora' Box

### • Institutional Barriers

- Lack of support for follow up
- Lack of continuity of care
- Lack of commitment and/or resources for family violence services

What helps?

### Parent support

- Home visitation
- Peer support
- Access to local resources
- Breastfeeding support
- Screen for maternal depression
- Refer to services for partner violence

### Trauma treatments

- EMDR (EMDR.org)
- Cognitive-behavioral therapy
- Medications

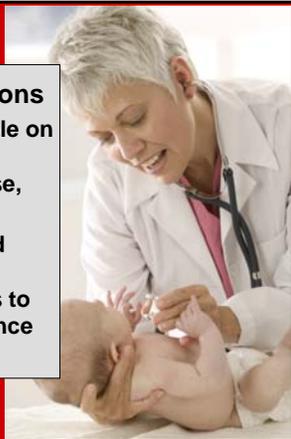

### • Alternative/adjunctive treatments

- Omega-3s (EPA and DHA)
- Exercise
- Sleep interventions

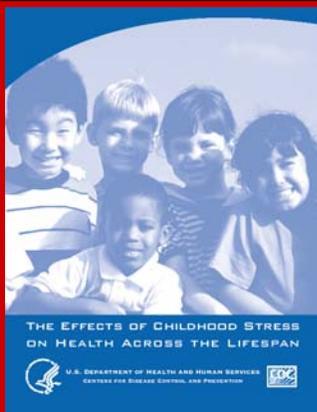

### Office-level interventions

- Have materials available on partner violence, depression, child abuse, family support
- Have posters, pins and other materials that indicates a willingness to talk about family violence

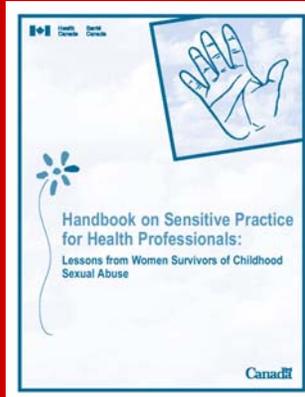

### Clinician Self-Care

- Supervision
- Team approach
- Vicarious traumatization
- Therapy

- CDC Report on Adverse Childhood Experiences

- From Health Canada

### Additional Resources

- Family Violence Prevention Fund – EndAbuse.org
- Crimes against Children Research Center – UNH.edu/CCRC
- Child Trauma Institute – ChildTrauma.com
